

# Learning L<sup>A</sup>T<sub>E</sub>X

Ryan Rubenzahl  
rrubenza@caltech.edu

Intro to Astronomy 2019

July 28, 2019

# Outline

1 What is  $\text{\LaTeX}$ ? Why should I use it?

2 How can I get  $\text{\LaTeX}$ ?

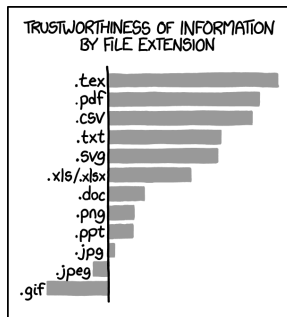

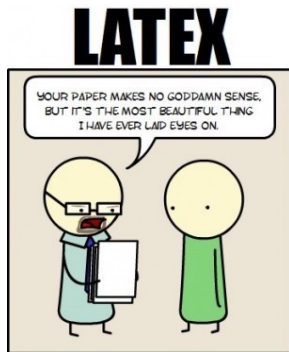

3 Learning  $\text{\LaTeX}$  / Getting started

4 Help/Troubleshooting Resources

5 Making a Document

# What is $\text{\LaTeX}$ ? Why should I use it?

- $\text{\LaTeX}$  (Lay-TECH or Lah-TECH) is a typesetting software that is designed for producing scientific and mathematical documents of high typographical quality
- $\text{\LaTeX}$  worries about formatting, you worry about content

# Outline

- 1 What is  $\text{\LaTeX}$ ? Why should I use it?
- 2 How can I get  $\text{\LaTeX}$ ?
- 3 Learning  $\text{\LaTeX}$  / Getting started
- 4 Help/Troubleshooting Resources
- 5 Making a Document

# How can I get L<sup>A</sup>T<sub>E</sub>X?

- So L<sup>A</sup>T<sub>E</sub>X will make my papers look beautiful and make me more trustworthy. How can I harness this power?
- Either install a **local T<sub>E</sub>X distribution**, or use an **online editor**
- T<sub>E</sub>X distributions:
  - T<sub>E</sub>X Live (GNU/Linux, Mac OS, Windows)
  - MacT<sub>E</sub>X (Mac OS)
  - MiK<sub>T</sub><sub>E</sub>X (Windows)
- May not include an *editor*, e.g. MacT<sub>E</sub>X comes with T<sub>E</sub>XShop, a L<sup>A</sup>T<sub>E</sub>X editor/previewer
  - Can always use your own favorite text editor (e.g. Vim), and compile from the command line via

```
pdflatex mydocument.tex
```

- **Online editor:** Overleaf (Google docs for L<sup>A</sup>T<sub>E</sub>X)

# Outline

- 1 What is L<sup>A</sup>T<sub>E</sub>X? Why should I use it?
- 2 How can I get L<sup>A</sup>T<sub>E</sub>X?
- 3 Learning L<sup>A</sup>T<sub>E</sub>X / Getting started**
- 4 Help/Troubleshooting Resources
- 5 Making a Document

# Learning L<sup>A</sup>T<sub>E</sub>X / Getting Started

- The tutorials on Overleaf are fantastic for getting started
- The TeX wiki is another great resource/guide
- Many great templates to try out on Overleaf
  - For professional journal templates, check out: REVTeX (aps, aip, prl, etc.)
- For a full-length starter guide, check out *The Not So Short Introduction to L<sup>A</sup>T<sub>E</sub>X* [1]

Learning L<sup>A</sup>T<sub>E</sub>X  
so your reports  
are more nicely  
typeset

Learning L<sup>A</sup>T<sub>E</sub>X  
because your tutor  
marks down  
Word-users

Learning L<sup>A</sup>T<sub>E</sub>X  
for that smug  
sense of elitist  
superiority

Learning L<sup>A</sup>T<sub>E</sub>X  
so you can  
understand  
memes

# Outline

- 1 What is  $\text{\LaTeX}$ ? Why should I use it?
- 2 How can I get  $\text{\LaTeX}$ ?
- 3 Learning  $\text{\LaTeX}$  / Getting started
- 4 Help/Troubleshooting Resources**
- 5 Making a Document

# Help/Troubleshooting Resources

- Unless you are literally a god, compiling your L<sup>A</sup>T<sub>E</sub>X document will probably not be error-free every time
  - e.g. `Underfull \hbox (badness 10000)`
- Google is your friend, but your best friend is
  - TeX stack exchange
- Forgot the command for that one symbol? Check out Detexify
  - Lets you draw the symbol, and tells you the code for it
  - If you have a Mac, you can download Detexify as an app!

# Outline

- 1 What is  $\text{\LaTeX}$ ? Why should I use it?
- 2 How can I get  $\text{\LaTeX}$ ?
- 3 Learning  $\text{\LaTeX}$  / Getting started
- 4 Help/Troubleshooting Resources
- 5 Making a Document**

# Basic Commands

- All command begin with a backslash ‘\’ and take one of two formats:
  - Command name consists **only of letters**, terminated by a space/number/‘non-letter’
    - e.g. `\LaTeX`, `\hfill`, `\newline`
  - Command name consists of a **backslash and exactly one non-letter**
    - e.g. `\,`, `\;`, `\{`, `\}`

- A command is written as follows:

```
\command[optional parameter]{parameter}
```

- One may also **define their own command**:

```
\newcommand{name}[num]{definition}
```

- `num` = number of parameters, which are referred to in definition by `#1`, `#2`, etc. Command is called with `\name` just like any other.

# Making a Document: Setup

- **Preamble:** section of code between `\documentclass` and `\begin{document}`
- Document Classes: Defined by `\documentclass[options]{class}`
  - *class* specifies the type of document, e.g. article, beamer, report, book, etc.
  - *options* specify the behavior of the document, e.g. font-size, paper-size, one/two column, etc.
- The preamble is also where one can **import packages**  
`\usepackage[options]{package}`
  - E.g. amsmath, amssymbol, hyperref, TikZ, physics, cancel, minted
- The actual document is then started with a `\begin{document}` and ended with `\end{document}`

# Making a Document: Example

## Example: The Preamble

```
\documentclass[11pt, letterpaper]{article}
\usepackage[top=2.2cm, bottom=2cm, left=1cm,
↪   right=2cm]{geometry}

\usepackage{fancyhdr}

\usepackage{physics}
\usepackage{amssymb, amsmath}
\usepackage{cancel}

\begin{document}
...
\end{document}
```

# Sections

- To define the start of a section, simply use the appropriate command:

```
\section{...}, \subsection{...}, \subsubsection{...}
\paragraph{...}, \subparagraph{...}
```

- The section will be in effect until a new section command is encountered or the document ends

- Only with report or book class: `\chapter{...}`

- Some sections do not take an argument, e.g.

```
\abstract, \appendix, \tableofcontents
```

- Sections can be cross-referenced with the use of **labelling**

## Example: Cross-referencing

```
\section{Introduction\label{sec:intro}}
```

```
Here is the intro, Section \ref{sec:intro}
```

# Environments

- A L<sup>A</sup>T<sub>E</sub>X **environment** is a way of grouping part of a document according to some formatting rules
  - Environments may be nested so long as order is maintained
- Declared with `\begin{environment}` and ended with `\end{environment}`
  - The main `\begin{document}` itself is an example of an environment
- Some common environments:
  - `itemize` for simple (bulleted) lists, `enumerate` for enumerated lists
  - `tabular`, `figure`, `minipage`, `center`, `quote`

# Writing Mathematical Equations

- For mathematical typesetting, use *AMS-L<sup>A</sup>T<sub>E</sub>X*  
`\usepackage{amsmath, amssymb, amsfonts, amsbsy}`
- See list of Greek letters and mathematical symbols
- Several different “math-mode” environments:

## Inline math-mode (source)

For `$x \ll 1$` we can...

## Inline math-mode (output)

For  $x \ll 1$  we can...

## Equation math-mode (source)

The equation of motion  
`\begin{equation}`  
`m \ddot{x} + kx = 0`  
`\end{equation}`  
 describes a harmonic...

## Equation math-mode (output)

The equation of motion  

$$m\ddot{x} + kx = 0 \quad (1)$$
 describes a harmonic oscillator.

# Writing Mathematical Equations

- More math environments:

## Unnumbered Eq. (source)

The Pythagorean Theorem,  

$$[ a^2 + b^2 = c^2 ]$$

## Unnumbered Eq. (output)

The Pythagorean Theorem,  

$$a^2 + b^2 = c^2$$

## Multiline Eq. (source)

The net force is  

$$\begin{aligned} F_{\text{net}} &= \sum_i F_i \\ &= F - F_f \\ &= m a \end{aligned}$$

## Multiline Eq. (output)

The net force is  

$$\begin{aligned} F_{\text{net}} &= \sum_i F_i \\ &= F - F_f \\ &= ma \end{aligned}$$

# Figures

## Example: Figure

```
\begin{figure}  
\centering  
\includegraphics[width=0.2\textwidth]{./Figures/cat.png}  
\caption{An image of a cat.}  
\label{img:cat image}  
\end{figure}
```

## Example: Figure

Figure: An image of a cat.

# Tables

## Example: Table

```
\begin{table}
\centering
\begin{tabular}{|c| ccc |}
\hline
x & 1 & 2 & 3 \\
y & 4 & 5 & 6 \\
\hline
\end{tabular}
\caption{Our data.}
\label{tab:table}
\end{table}
```

## Example: Table

x	1	2	3
y	4	5	6

Table: Our data.

# Managing References I

- L<sup>A</sup>T<sub>E</sub>X has two main, and very powerful, ways to manage a bibliography
- **thebibliography environment**

## Example: thebibliography [1]

```
Part1~\cite{pa} has
proposed that \ldots
\begin{thebibliography}{99}
\bibitem{pa} H.~Partl:
\emph{German \TeX},
TUGboat Volume~9, Issue~1 (1988)
\end{thebibliography}
```

## Example: thebibliography

Partl [1] has proposed that ...

H. Partl: *German T<sub>E</sub>X*,  
TUGboat Volume 9, Issue 1  
(1988)

- Remove label option to have entries enumerated automatically

# Managing References II

- L<sup>A</sup>T<sub>E</sub>X has two main, and very powerful, ways to manage a bibliography
- BibTeX
- Reference entries are stored in separate .bib file
- Reference section is created with one line in main .tex file:  

```
\bibliography{references.bib}
```
- .bib file has entries stored in specific formats, which L<sup>A</sup>T<sub>E</sub>X understands and formats for you!
- Overleaf has a fantastic set of tutorials on how to setup a bibliography both of these ways

# Extra: Whitespace

- Whitespace before a line is ignored
- Whitespace after a command is ignored
  - Easy fix: add an empty parameter {}, e.g. `\LaTeX{}`
- Whitespace (larger than a single space) between words is ignored
- A single line break is treated as normal whitespace
- $\geq 1$  empty line between two lines defines the end/start of a paragraph
- Create your own whitespace using
 

```
\hspace{5pt}, \vspace{-3pt}, \, \,; \quad \qquad,
↪ \hfill, \vfill
```
- For line (page) breaking, use `\newline` or `\\` (`\newpage`)
  - `\clearpage` will fill the remaining room of a page with whitespace

## Extra: Text/Comments

- Words can be monospace, *emphasized*, **bolded**, *italicized*, and **colored!**

```
\texttt{text}, \textbf{text}, \textit{text}
\emph{text}, {\color{color}text}
```

- Change size of font on the fly using one of

```
\tiny, \scriptsize, \footnotesize, \small,
\normalsize, \large, \Large, \LARGE, \huge, \Huge
```

- The default font is **Computer Modern** (CMU, sans serif in beamer)
  - One may change the font throughout the document by adding, for example, `\usepackage{Palatino}` to the Preamble
- Make footnotes with the `\footnote{footnote text}` command<sup>1</sup>
- Comments may be written using the percent sign %

---

<sup>1</sup>The footnote text shows up like this.

## Extra: Common Mistakes

- Quote marks: begin your quote with ```, end with `'`
- Certain symbols like underscores will not work outside of math mode
  - If you need it, you can usually escape it with backslash: `\_`
- Be careful with exponentiation: `$10^{-23}$`
- Format parenthesis in equations properly: use `\left` ( `\right` )
- Put text inside a math environment with `\text {}`
- L<sup>A</sup>T<sub>E</sub>X is not always the most intuitive - **there is a learning curve!**
  - You will spend 15 minutes at one point fighting with the float-placement algorithm
  - Most issues are easily google-able, or are on TeX stack exchange
